I have 3 zones installed on 3 different ZFS file systems. The file system is not supposed to be read-only but whenever I try to modify the httpd.conf it says it is read-only for root.

```
root@blogs # zfs get rdonly zpool1/zones/media-zone
NAME PROPERTY VALUE SOURCE
zpool1/zones/media-zone readonly off local
```

I'm obviously misunderstanding something pretty simple. Does anybody know what am I doing wrong?
