Hi managers

I've just added a new processor, and done lmf reset with an updated license, but for some reason, the processor won't come online. I've tried a reboot, but it has no effect.

```
# /usr/sbin/psrinfo
```

```
0 on-line since 02/27/2004 14:49:42
```

```
1 off-line since 02/27/2004 14:49:42
```

```
# /usr/sbin/lmf list
```

```
Product Status Users: Total Active
```

```
OSF-BASE active unlimited
```

```
OSF-USR active unlimited
```

```
MONITOR-UNIX active unlimited
```

```
FORTRAN90-O active unlimited
```

```
FORTRAN-O active unlimited
```

```
CXXOSF active unlimited
```

```
OSF-SVR active unlimited
```

```
DECEVENT terminated
```

```
# whoami
```

```
root
```

```
# /usr/sbin/psradm -n -a
```

```
psradm: processor 1: Permission denied
```

```
# /usr/sbin/online -v
```

```
online: processor 1: Permission denied
```

Why is processor 1 refusing to respond to online? I thought root could "do anything".

Cheers

Derek
