Hi all,

Presently I have a single node TruCluster 5.1 using Memory Channel acting as a development Server. Due to some pre-requisite of Oracle 10G we need to upgrade this cluster to TruCluster5.1B.

Since this is a Development server, Data is more important than the downtime.

Can you please suggest me the best way to upgrade this Cluster i.e.–

a. Scraping local basic OS disk & re-install Tru64Unix with Cluster components for 5.1B &

then mounting old data\_domains/Disks. Is this safe? Do I need to create some CDSLs etc.?

b. Rolling upgrade from 5.1 to 5.1A & then 5.1B

If possible, Please do let me know some links for best practices.

Thanks & regards.

Vimal
