Major part of this was that we still had 2 domain controllers running 2000. After installing only the NFS Authentication service package from Microsoft Windows Services for Unix, that took care of most of my problem. I still have some issues, such as some Unix accounts are able to write to the directory, but cannot delete what they've written there. I'll keep working on it...

Subject: NFS connections to Windows 2003 Storage Server getting "Permission Denied"

Running Tru645.1B-3 trying to set up an NFS client share to a Windows 2003 Storage Server set up as a NAS head on my EVA3000. I can set the NFS mount up through the GUI and get no errors, but when I try to open that directory, I get a permission denied error. I have another W2K3 Storage Server that I can connect to and set up the share with no problem. I have tried opening the permissions wide open. I copied the username and group files from the server that does work to the server that doesn't. The username and group mappings are exactly the same. Some folks I have talked to have pointed me to Unix for Windows 3.0, but I shouldn't have to use it if I'm running W2K3 Storage Server. The mappings and everything are set up there. Does anyone have any experience with this and lend some friendly advice?
