Software vulnerabilities still dog operating systems

<http://www.theinquirer.net/?article=13420>

"Proprietary systems are the least vulnerable

The operating systems with fewest vulnerabilities in 2003 are HP's OpenVMS, IBM's OS/400 and IBM's zOS.

These three are all proprietary and they all have security that is fully integrated, not applied as some kind of after-thought. Certainly they come with a decent price-tag but they can be well worth the money when the result is fewer security problems, less unscheduled downtime and less downtime for patching."

...

"the most secure operating systems continue to be certain proprietary systems from HP and IBM. Some may refer to these more secure systems as legacy systems but if legacy means secure and reliable it seems that legacy should be the preferred option."
