An ugly way to do what you want, but sure. What the heck.

The DECW\$GREET.TXT mechanism in V1.3-X is a direct response to the cited requirement.

The XRESOURCES method is a standard CDE mechanism and allows you to do it without the separate popup dialog (again noting that in old versions the widget attachments were pretty poorly done and limited the number of lines) – and still allows you to put a standard or custom logo in the login box.
