SHADOW\_MAX\_COPY could be much higher for your DS20E without causing any trouble, but setting it to 2 is fine. You should probably consider tuning SHADOW\_MBR\_TIMEOUT to something reasonable for your hardware configuration. On some of my systems I use 60.

I haven't seen it mentioned here, so don't forget ALLOCLASS, either. There is a document in the doc set just for volume shadowing. I would take a good look at the doc, and follow the instructions therein. Refer to your own "local" copy of the docset, BTW – HP's website no longer carries V7.2-1 docs, and there may be differences between V7.2-1, and the "current" versions.
