It's a good chance that satanic incantation was CTRL+SHIFT+F3. This enables the "dead rodent" mode. This allows you to use the arrow keys and the three keys directly above it (SELECT, PREV and NEXT on an LK4xxx) as the three buttons of the mouse.

Thanks !

How come stopping the DECW\$MWM and/or DECW\$SERVER didn't reset this and it required a reboot ?

Is this hardware specific ? At what level is this handled ? Would this work on all VMS platforms ?

I just tried it out. I'm at a VAXstation 4000/90a with a few DECterms and logged in via LAT to other nodes in the cluster. Can toggle back and forth. No reboot required.
