Hello

I have runned Windows as long as i can remember, but last night i found out that i wanted to try ut FreeBSD. I want to dual-boot, so i can use both OSes.

So, i downloaded the CD's, burnt them and labeled them properly.

I have three hard disks which had a total of ten partitions.

These were:

Disk1 (80 Gb it says, it's acctually ~75 Gb)

C: 10 Gb, containing WindowsXP

D: 10 Gb

E: 30 Gb

F: 5 Gb

G: 20 GB

Disk2 (80 Gb here to)

H: 25 Gb

I: 25 Gb

J: 30 GB

Disk 3 (120 Gb)

K: 40 Gb

L: 80 Gb

All my partiotions were quite full of data, but after a while i managed to empty one of the partitions. It was the D: -partition, 10 Gb. This is were i want to install FreeBSD.

I formatted this one, and deleted it, using "Administratve Tools" in Windows.

Now i inserted the CD labeled "Boot Only", and rebooted my computer. The installer started. I was soon asked where i wanted to install FreeBSD. I choose my first hard disk.

But, here's my problem:

After selecting hard disk to install to, i get a message where it says that my hard disk geometry is wrong. I pressed OK and hoped that it wouldn't matter that much. After that, i got this Fdisk-screen. But it's just showing MBR (64 bytes or so), my first partition (the one with Windows on), a big

comp.unix.bsd.freebsd.misc: The installer can't find my partition

partition at 60 Gb and some 21 Mb free space after that.

Why does it show a 60Gb partition, and not 1x10 Gb with free space and these other partitions i've got on the first hard disk?

Thanks in advice.

/Andreas
