GMailFS uses FUSE (<http://fuse.sourceforge.net/>). On the FUSE web page it says that you don't need to recompile the kernel. However, it also says that FUSE is a kernel module, so I guess it won't work.

Both GMailFS and libgmail are written in Python, so any Python buffs out there could try to adapt it for FreeBSD.

The OP could always try Filebunker (<http://filebunker.sourceforge.net/>) it might for work him.
