Hi All

Installed FreeBSD i386, Rel 6.2 on a machine thats got an i945 chipset on the motherboard, integrated video too. Everything seems to be supported, SATA controllers the lot... but no AGP or DRM support?

i have the statements

```
device agp
device drm
device i915drm
```

in my kernel conf, after building the new kernel.

```
dmesg |grep agp
dmesg |grep drm
```

Returns absolutely nothing....

The i945 has been around for a while now.. Whats missing here? the actual motherboard has the video card integrated. This motherboard has no AGP slot on it, only PCI-E for a video card. I am not sure whether the onboard integrated graphics is wired into AGP or PCI-E

Would this make a difference? is there any workaround/solution?

And yes, the whole point is to get DRI working in X.

Cheers
Alex
