Hi

I'm trying to find a good platform for FreeBSD 7.0 based web and database servers.

FreeBSD certified hardware listed at <http://www.freebsd.org/commercial/hardware.html> are not available in my area, so I obliged to choose the mid-level solutions from Dell, HP and IBM.

I would be happy if someone will give me some feedback about his experience installing FreeBSD on any of Dell, HP or IBM servers.

I know that my question is quite broad: my aim is to investigate the level of FreeBSD compatibility with each of three major brands available in my region.

Thanks,
Eugen
