Tried going back to stock speed? Overclocking puts stress on a system which may show up only under extreme loads--- and compiling a new system is a pretty hefty load.

Secondly, have you checked for RAM problems? MemTest86 at <http://www.memtest86.com/> is a great program for that, and a free download. There's also MemTest86+, a derivation of that project at <http://www.memtest.org/>. Download one or both programs, copy to floppy/cdrom, and boot off them to run at least overnight. If there are any memory errors, FIX THEM.
