

comp.unix.questions: Execute all processes in the background from bash.

Execute all processes in the background from bash.

I was wondering if it's possible to prepend "time" and append "&" to all commands that I execute in bash. For example I'd like
\$ mozilla
to expand to
\$ time mozilla &
to time it and execute it in the background. Anyone know if this is possible using bash, maybe with environment variables? It's quite inconvenient to type time before and & after every command that I execute.
Thank you.
