I can no longer access ftp.sco.com over my high-speed Internet connection (a few months ago I could). I can connect to SCO non-FTP servers, and to other non-SCO FTP servers.

My high-speed Internet connection is over a wireless system provided by a local company. As a backup, I maintain a dialup account with Earthlink.

I can access ftp.sco.com with the dialup.

I can access ftp.sco.com at work (a different ISP), and my friends with other ISPs in the local area can also access ftp.sco.com.

I've asked my wireless ISP to look into the problem and here is part of their reply:

We can't log in through the wireless, but we can through a dialup. We have no answer as to why you could connect through the wireless a few weeks ago, but cannot do so now. When we upgraded our T1's in April, we changed the DNS numbers from Time Warner to NewEdge references. We just don't have an explanation for why 3 months or so later it would stop working. We can log into other FTP sites just fine through the wireless. This tells us that there is something that has changed on SCO's end.

When I read this I come to a different conclusion: something has changed at the ISP's end, not SCO's. There is a possibility that the last time I connected to ftp.sco.com (to download 507's MP1), it was before my ISP upgraded their T1. Could their changing DNS numbers have an affect on just ftp.sco.com?

Looking for comments from those that know more about Internet connections than I do so that I can prepare a sound reply to my ISP.

TIA,

DDinAZ
