

Brand new Sun Fire V120 – can't find ethernet ports

I've just setup a V120 and it seems OK, except that it doesn't see the ethernet ports. I started by connecting the "Net 0" port to a hub (which is live and connected to the rest of the network) and the "LINK" light came on. Then booted up (for the first time) and tried to do the network config – and it kept saying there was an error setting the IP address on the interface. Eventually, after playing this game for a while (trying various answers to the questions), I told it that it wasn't networked and was able to get it setup and logged in as root. Then, I did: `ifconfig -a` and it says `lo0` (loopback) is the only device. Note that throughout all this, the LINK light glowed peacefully.

Barring an actual hardware problem, is there some software/LOM/OpenBoot "magic bullet" to make it work?

P.S. As far as I can tell, the interfaces should be `eri0` and `eri1`. We also did the various hardware tests (`obdiag`) in the OpenBoot and they all reported success.
