Well silly me for looking in the docs directory at a file called mkisofs.man instead of in the compiled directory for a file called mkisofs.8. I did do a "find -type f | grep -i man" in attempt to find additional man files. The file in the docs directory are both dated 12/24/02..

I do know what version I am using. I am running these with an explicit path. I keep the versions locally rather than install it on 20 systems. So keeping track is not a problem.

It may be but the output looks the same. I eventually found a 2 year old newsgroups thread where you go back and forth with another person having the same problem as me. What happens is there are warning messages but they don't effect the look of the CD on a Unix host. Yet I am pretty sure those warnings did rearrange the CD in 1.11. So my earlier experiences with program don't apply today. After reading that post I think I understand your logic in the warning messages.

comp.unix.solaris: Re: Creating a CD with Long Filenames

But they get a little messy when you are creating a 4 gig DVD.

Thanks for the program by the way. It may be getting a good workout in the near future if we stick with it during our archival process.
