

comp.unix.solaris: how to send control-break or ctrl-c signal to background process?

how to send control-break or ctrl-c signal to background process?

Dear all,

I have sent a job to run in background... However I now want to gracefully terminate it. This software has a good property that if I press control-break, or ctrl-c, it will enter into a graceful termination mode that it can still give me some partial useful information... so I don't want to use "kill -9" to kill it...

instead, since it is run in background, I hope I can sent it a control-break or ctrl-c signal then it can output some partial useful information to the log file and then gracefully shutdown...

Can anybody help me on how to do that?

Thanks a lot,

-walala
