Update:

I swapped out the 2.9 disc and replaced it with a 2.8 Sun pre-installed disc from another SunFire. The system booted and completed the system config.

However, when booting with the 2.8 disc I still get the

WARNING: /pci@1c,600000/scsi@2 (glm0):

unexpected SCSI interrupt while idle

error message, but the system still boots OK.

What does this "Cannot assemble drivers for root /pci@1c,600000/scsi@2/disk@0,0:a" mean?

Cheers, Z.

"Zii Ell"

> *I have inherited a new SunFire. I've been told that its disc was pre-installed with Sol.2.8 and then jumpstarted with a fresh 2.9 installation. After the 2.9 installation the system enters a continuous reboot cycle with a SCSI error. I have included the info below. Although this is a SCSI error, I wonder if this is a problem with the disc or the rest of the machine?*
