hi folks –

have a solstice backup environment i inherited.

have 1 server (say "A"), and 4 clients (say "B,C,D,E")

regularly backup data from all clients, and reports look good – successful backups.

now, when i try to recover files from tape, i start nwrecover, change client to, say "C", then pick a file from the GUI tree, and start recover.

For some reason, the file gets written to server "A" instead of client "C"

any insight ???

Thanks
Steve
