WHOOOPS! sorry. this is solaris 10.  
i'm trying to learn this.

i did this;

```
svccfg -v import /var/svc/manifest/milestone/ar1_null3.xml
```

now i want to get rid of it, all traces, forever.  
that doesn't seem to be what "export" does.

i presume it's not sufficient to move or delete the input file.  
if it's in the man page, i must be looking for language that  
i'm not finding.

thanks.

j.
