Hi,

This is not a new issue for me but I keep getting bugged by it everytime I need to write a long specification.

Why does a Staroffice 8 consume 45% of my CPU when I am not writing anything, and it is so slow.

I have tried to locate some support from SUN on their suport web but can't find any forum which is alive!

On my windows laptop it is running fine.

/michael

What is the spec of the machine? What version of Solaris?

I had a similar problem with the 3rd party program Mathematica on slower machines. My 450 MHz quad processor Sun Ultra 80 is too slow.

This is due to a change of behavior in select() on Solaris 10. That used up loads of CPU time. I doubt it is the same issue, as Sun would have more likely noticed a problem with a program they produce (StarOffice) than one produced by a 3rd party (Mathematica). But the symptoms are similar.
