tim thanks for your reply. I tried that out but I'm getting the error "
xterm Xt error: can't open display: localmachine:0.0....what do you mean by "export it" and do ?I have to be root on the remote machine?

Depending on your local environment, the display number can be any number, not only 0.0
Just enter `echo $DISPLAY` on the localmachine before setting it on the remote system.

Example:

On local machine give command `xhost + echo $DISPLAY` (which may return sth like `:17.0`)

On local machine set `export DISPLAY=localmachine:17.0` (where local machine is the name or ip of your machine and shell is bash)

Then start application on remote system.

You don't have to be root.

Gruss / Cheers

Robert

Hey Guys,

I tried all suggested options....ie:

on local host: `xhost +ssci1 <-----my machine`

Re: telnet session problem

That should be "xhost +10.20.x.x" or even "xhost +" to be sure.

.
