Also where in this f***ing package management system can i figure out where i get the SUNWdcm package which contains the GUI for fbconfig.

On the installation media?

And is there a command that tells me on which of this 6 disk ? Or download it in case i don't have the media in my hand. Oh my god, Solaris sucks so much in usability. Sun should really pay a few people in Bangalore to fix this instead of hacking on Java.

Anybody here who has the private email address of Mr. Schwartz? Or better Mobile Number?

Did you ever bother to read any of the man pages, web based documentation, the README's on the CD's? There is even documentation on how to get a single server across multiple cards/displays. The installation of multiple monitors/cards is so well documented in so many places that I suspect the you are simply looking for a reason to complain about Solaris. Unlike Linux and Windows Solaris works as documented. There are no magic "oh you have to recompile the kernel and do mumble mumble" to get that to work. All you had to do was type "man Xsun". My son is a computer engineering student and uses Solaris on his home computer. He had to use Linux for the first time this semester as part of a Data Structures course and his comment was "Linux S**KS"
