Thanks everyone!

Now I got a good understanding of how to control the compiler output for my S10 AMD platform

So are there any compiler flags that determine whether its for sparc or x86? or just compiling it on AMD makes it portable to any x86?

The compilers are not cross-compilers; they only generate code for the platform they run on. If you avoid the platform specific options (including -fast) you will get a 32 bit executable which can run on any S10 x86 system.
