What do you mean "almost everything" ?

My keyboard is brazilian portuguese but I am using a english layout.  
So it will generate some wrong letters when I type some keys like ç  
^ ; . That causes beeps on console or vi because that.

I can neither:

- set up the correct layout
- remove the beep.

Well, it is difficult to use the Solaris console (text mode) on that conditions.

[...]

What is your hardware ?

P4, not SPARC.

Are you using an USB keyboard ?

Yes

What is your keyboard setting in eeprom ?

English. That is my better option now.

## Re: beep on text console

Okay, so the real issue is the wrong layout, not that much the beep which is more of a symptom.

You can use the "dumpkeys > file" command to create a keyboard configuration file, then adjust it to your actual keyboard layout and finally apply the changes with the "loadkeys file" command.

You may also want to see the files in /usr/share/lib/keytables/type\_6/ directory as examples for this customization. (man keytables for the format).

I suggest you to have a remote connection ready to reset the keyboard should something goes wrong ...
