

Broken pipe on Solaris 8

Hello,

I'm writing a tcp/ip client server application and have to my surprise seen a broken pipe problem recently. Essentially the process quit with broken pipe.

However I have the following code in place which works on most other unix platforms (linux, mac, hp-ux, aix, etc) that the software is compiled on. I'm only seeing this problem on Solaris 8 on sparc:

```
struct sigaction act, oact;

act.sa_handler = SIG_IGN;

sigemptyset(&act.sa_mask);

act.sa_flags = 0;

sigaction(SIGPIPE, &act, &oact);

send/recv call...

sigaction(SIGPIPE, &oact, NULL);
```

Is there another way on solaris I could disable SIGPIPE?

Thanks.
