Newbie here!

Ok, I compiled and link the driver.
I created an installation script that appears to load the driver
(running OS). I'm getting debug messages that displays the execution
of the `_init` routine.

How do a load the module or create the device name.

I have a test program that uses the device name, `"/dev/catds0"`. How do
I get the device name in `/dev`?

try `/usr/sbin/audlinks`

.
